

BEYKAN GÖZÜMOĞULLARI

Certified SAP MDG Consultant
MDG / ABAP / Fiori
beykangozumogullari@gmail.com | LinkedIn | Website

Education

Qualifications	Industrial Engineering Uludağ University, Turkey
Languages	English (fluent) Turkish (native)
Nationality	Turkish

Professional Experience

Short Profile

Beykan Gözümoğulları is an SAP MDG Consultant focused on the technical implementation and enhancement of SAP Master Data Governance solutions. His experience covers Business Partner, Material and Finance master data, as well as ABAP OO development, BRF+, MDG workflow, validations and derivations, UI enhancements, and system integration. He has contributed to implementation, go-live and support activities across projects in different industries, including automotive, energy and manufacturing.

Core Competencies

MDG Domains: Material (MDG-M) | Business Partner (MDG-BP) | Finance (MDG-F)

MDG Development: ABAP OO, BRF+, workflow enhancements, validations & derivations, UI enhancements

Integration & Replication: SOAP Web Services, Data Replication Framework (ALE), OData

Architecture: S/4HANA Master Data Hub-System Concepts (Design & Implementation)

Data Quality & Processing: DQM, Mass Processing & Consolidation

SAP Projects

Apr 2026 – still ongoing ~ *Porsche AG*

Sector: Automotive

Description: Porsche and Volkswagen operate separate SAP MDG hub systems. To support Business Partner creation in Porsche, a custom lookup solution was implemented within the Change Request. Users can synchronously search Business Partners from the Volkswagen MDG system via SAP standard OData service API_BUSINESS_PARTNER, select a result, and transfer the relevant data into the Porsche Change Request.

Contribution details: Designed and implemented the technical solution for the cross-system Business Partner lookup and data transfer within the MDG Change Request.

May 2023 – still ongoing ~ *Siemens Energy*

Sector: Energy Systems

Description: Several systems are integrated in the project, which makes key mapping complex to maintain. A custom program was developed to identify key mapping inconsistencies, classify them by problem type, and apply the appropriate correction logic.

In the S4E project scope, naming convention rules were also implemented for MDG-F, covering both Accounting and Controlling. The solution supports dynamic key generation and determines the correct hierarchy assignments based on defined rules.

Contribution details: Responsible for the technical implementation of the key mapping correction solution and MDG-F key generation logic.

Apr 2023 – Apr 2024 ~ *Stellantis*

Sector: Automotive

Description: SAP MDG Mass Processing was used to support the handling of large data volumes. Validation checks were implemented within the Mass Processing process to ensure that the processed data followed the required business rules and data quality requirements.

Contribution details: Responsible for the technical implementation of the Mass Processing enhancements and validation logic in SAP MDG.

Dec 2022 – still ongoing ~ *Huf-Group*

Sector: Automotive Supplier

Description: Together with the medepia development team the S/4HANA master data hub concept is realized for material master data and also business partner data. An MDG framework has been introduced to control the MDG workflow and user interface behavior (UIBBs and field properties). Standard MDG BAdIs were used for validations, derivations, and dynamic user-agent determination.

Further integration with 3rd-party systems (ASTRAS for customers and PDM for material) is in place. For the integration standard SOAP web services were used.

CDQ Data Provider Integration is accomplished for MDG classic-mode. Business Partner creation is possible with CDQ's BP Lookup API.

Contribution details: Responsible for the technical implementation of MDG workflow and UI enhancements, validation and derivation logic, and external system integrations.

Oct 2022 – still ongoing ~ *Vaillant*

Sector: Heating, Ventilation and Air Conditioning

Description: Material master data is initially created in the non-SAP PLM system PTC Windchill. After creation, an MDG-M enrichment process is triggered in SAP MDG, where different departments enrich the material through multiple workflow steps. The process supports parallel and plant-dependent Change Requests, allowing separate Change Requests for the same material at different plants.

The workflow also includes a background costing run to calculate the standard price. Several standard MDG BAdIs and BRF+ rules are used to control workflow and UI behavior, including dynamic user-agent determination, workflow-step skipping, parallel workflow handling, dynamic field properties, validations, and derivations.

Contribution details: Responsible for the technical implementation of MDG-M workflow logic, UI behavior, validations and derivations, and BRF+ based control logic.

Competencies

Operational / Professional	Strong analytical and problem-solving skills Able to work between technical and functional requirements Quick to understand new topics and project-specific processes Takes responsibility for assigned topics and follows them through to completion
